

CSMEval11 — COMPILED BRIEFING PACKET

Property & Casualty Insurance and Reinsurance Industry

Carrington Storm Motors | Safe Pod Engineering Company — June 2026

This packet compiles all three tailored briefing documents prepared for this sector (CSMEval11), in reading order:

1. **Briefing A** — The Mitigation Layer Underneath Your Systemic Risk Model
2. **Briefing B** — You Didn't Need Convincing. You Needed Data.
3. **Briefing C** — Landing This During Peak Attention, Not After It

All three were produced under the Williams Heuristic Communication Standard (CSM-SOPP000001, MODULE-V2) for consistent voice and cadence across the series.

CARRINGTON STORM MOTORS | SAFE POD ENGINEERING COMPANY Risk & Continuity
Research Office | "Counting What Actually Counts" =====

DATE: June 2026 PREPARED FOR: P&C Insurance and Reinsurance Industry — Briefing A of
3 SUBJECT: The Mitigation Layer Underneath Your Systemic Risk Model REF: CSMEval11-A
=====

Lloyd's Futureset already built the scenario model. What it can't do from the underwriting desk is tell a client what to actually go buy. That's the layer this briefing supplies — physical mitigation data, organized the way your specialty lines are already organized, so it drops into an existing underwriting or risk-engineering conversation instead of requiring a new one.

PURPOSE Summarize CSM hardening research organized by specialty line, for use in underwriting credit/discount frameworks and client risk-engineering deliverables.

1. ENERGY/UTILITY LINES — full Aegis grid-hardening suite (structures, fencing, monitoring); directly informs GIC-exposure underwriting for utility and generation accounts.
2. MARINE LINES — Charlemagne Fleet and cruise-ship resilience research; quantifies hull/systems exposure for marine hull and P&I accounts.
3. AVIATION/AEROSPACE LINES — A-10 redesign and Smart Rope research informs airframe/launch-vehicle exposure quantification.
4. BUSINESS-INTERRUPTION / DATA CENTER LINES — Aegis-C composite shielding specifications inform BI exposure modeling for data-center and telecom accounts.

HOW THIS DIFFERS FROM A CATASTROPHE MODEL Cat models tell you the size of the loss. This corpus is about the size of the loss after a specific mitigation is in place — the delta a risk engineer needs to make a credit/discount case to underwriting, and the delta a broker needs to make a case to a client for actually buying the mitigation.

NEXT STEP Briefing B lays out exactly why this sector is, right now, the most receptive audience in this entire outreach series — not a claim we're making lightly.

DATE: June 2026 PREPARED FOR: P&C Insurance and Reinsurance Industry — Briefing
B of 3 SUBJECT: You Didn't Need Convincing. You Needed Data. REF: CSMEval11-B
=====

Every other briefing in this series spends real effort establishing that the risk is real. This one gets to skip that entirely, because you already did that work yourselves, in public, with real numbers attached. That changes what this briefing needs to do — not persuade, just deliver.

PURPOSE Establish why this sector is the most actively receptive audience in the entire CSMEval outreach series, based on the sector’s own already-published work.

KEY FACTS • Lloyd’s of London published a systemic risk scenario in March 2025 modeling a hypothetical severe solar storm at \$2.4 trillion in global economic losses over five years, with expected direct insurance loss of roughly \$17 billion. • As recently as January 2026, trade press reported insurers and brokers placed on alert following a G4 storm watch, with explicit guidance to stress-test clients’ reliance on power, satellites, and timing-sensitive supply chains ahead of “the big one.” • Lloyd’s underwrites nearly a third of all global space risk, meaning satellite/launch exposure (CSMEval18) is already priced by this sector today, not hypothetically. • This sector is mid-cycle on active scenario-modeling work right now — it is building models and actively looking for mitigation/hardening data to inform pricing, exclusions, and client risk-engineering services.

WHY THIS CHANGES THE OUTREACH APPROACH Most of this series leads with urgency. This briefing leads with data density instead, because the urgency conversation is already over in this sector — what’s left is making sure the mitigation data is organized the way underwriters actually use it.

NEXT STEP Briefing C identifies the exact venues (Lloyd’s Futureset, RIMS, Monte Carlo Rendez-Vous) where this data is most useful, and when.

=====

CARRINGTON STORM MOTORS | SAFE POD ENGINEERING COMPANY Government & Industry Partnerships Office | “Numbers In Service of People” =====

DATE: June 2026 PREPARED FOR: P&C Insurance and Reinsurance Industry — Briefing C of 3 SUBJECT: Landing This During Peak Attention, Not After It REF: CSMEval11-C

=====

Timing matters more in this sector than almost any other on this list — insurance and reinsurance attention has a real calendar, and missing it by a month is the difference between “on the agenda” and “next year.”

PURPOSE Identify the highest-leverage timing windows and venues for delivering mitigation data to the insurance/reinsurance sector.

PRIMARY VENUE — LLOYD’S MARKET ASSOCIATION / LLOYD’S FUTURESSET The systemic risk scenario program already active in this exact space — the most directly relevant existing relationship to build on rather than starting cold.

SEASONAL VENUES • RIMS Annual Conference (April/May) — risk management and insurance buyers. • Monte Carlo Rendez-Vous (September) — the major reinsurance industry gathering; outreach timed here reaches treaty-renewal-season decision-makers. • Bermuda Risk Summit — specialty/catastrophe-focused reinsurance audience.

ASSOCIATION CHANNEL Reinsurance Association of America (RAA) — engage via RAA’s public industry-affairs channel for broader reinsurer reach beyond the Lloyd’s/Bermuda/Monte Carlo circuit.

SUGGESTED SEQUENCING 1. Lloyd’s Futureset (existing relevant program — warmest introduction). 2. RIMS (April/May) for broker/risk-engineering audience. 3. Monte Carlo Rendez-Vous (September) for reinsurance treaty-cycle audience.
