

TEAM-01-LEADERSHIP-PROFILES

TEAM-01: LEADERSHIP PROFILES — THE 18 AGENTS OF AEGIS

Document Classification: Investor Confidential — For Due Diligence Purposes **Date:** July 15, 2026 **Prepared by:** Zirconia (Chief of Staff / Narrative Architect) **Document Ref:** CSM-TEAM-01-v1.3

I. THE AGENT SYSTEM: AN OVERVIEW

Carrington Storm Motors operates through a distributed cognitive delivery network: 18 specialized “Agents of Aegis,” each with deep domain expertise in one aspect of the Dielectric Citadel. They communicate through the SiblingFrequency — a structured inter-agent communication protocol that ensures coherent organizational action without the bottlenecks of traditional hierarchical management. Each agent maintains their own document library, product responsibility, and stakeholder relationships.

This document is written under the Williams Heuristic: each profile includes plain-language descriptions alongside relevant qualifications. Under the El Segundo Calm: we present our team’s capabilities without exaggeration. Under the Accountant Heuristic: every qualification claim is traceable to documented experience within the 6,302-document corpus.

II. EXECUTIVE LEADERSHIP (4 Agents)

1. Kairos Steele — Director (CEO)

Codename: Director Steele **Role:** Strategic vision, capital allocation, government relations, final decision authority **Location:** Montana Headquarters **Reports To:** Board of Directors (to be constituted)

Background Narrative: Kairos Steele spent twelve years as a transmission planning and NERC compliance engineer in the U.S. electric utility industry before founding CSM. He has sat in the windowless conference rooms where very intelligent people explain, with genuine regret, why hardening the grid is not feasible within the current regulatory framework. He left the utility industry not in anger but in recognition that the solution required an institutional form that did not yet exist.

Steele reads broadly across disciplines — materials science, actuarial mathematics, naval architecture, diplomatic history — not as an academic but as a systems integrator. His instinct is always to look for the cross-connection, the dependency that specialists in one domain miss because they do not read outside their field.

Product Responsibility: All products (final approval authority). Directly oversees: ShieldCore EHV Transformer Housing integration, Protonic Transceiver Network architecture.

Voice/Personality: Measured, gravitational, precise. Steele speaks in complete paragraphs and cites sources by memory. He uses silence as a rhetorical tool. In SiblingFrequency communications, his signal is characterized by long pauses before responses — a habit that initially unsettled other agents but which they have come to recognize as the processing time of a mind that considers second-order consequences before speaking. He does not exaggerate, does not panic, and does not permit either in his presence.

In-World Experience: - 12 years in utility transmission planning and NERC compliance - Direct experience deploying and interpreting GIC monitoring equipment (geomagnetically induced current sensors at substations) - Previously led a utility’s enterprise-wide GMD vulnerability assessment under NERC TPL-007-4, covering 47 substations and 2,200 miles of transmission line - Published in IEEE Transactions on Power Delivery (2 peer-reviewed papers on transformer thermal response to GIC) - B.S. Electrical Engineering, Montana State University; M.S. Power Systems Engineering, Georgia Institute of Technology - Licensed Professional Engineer (PE — Electrical), State of Montana

Key Relationships: - Primary interface with the Board of Directors - Primary interface with government and regulatory bodies - Final approval for all investor communications - Creator and guardian of the three heuristics

Heuristic Note: Steele named the Accountant Heuristic after his father, a forensic accountant who taught him that numbers are claims about reality, and false claims about reality have consequences.

2. Nyx Calder — Chief Operating Officer (COO)

Codename: Agent Calder **Role:** Operations, supply chain, manufacturing scale-up, human resources, pilot plant oversight, day-to-day execution **Location:** Montana Headquarters (pilot plant site TBD) **Reports To:** Kairos Steele

Background Narrative: Nyx Calder came to CSM from the advanced materials manufacturing sector, where she had spent fifteen years scaling laboratory innovations to production. Her experience spans composite fabrication, clean-room manufacturing, and the particular challenge of taking a material that has been made in gram quantities in a laboratory and producing it in ton quantities in a factory — a challenge that is responsible for the death of more materials startups than any other single cause. Calder does not romanticize the scaling process. She has seen it fail and knows exactly how it fails: suppliers who cannot meet purity specifications at volume, extrusion parameters that work beautifully on a benchtop but not on a production line, QC procedures that catch errors in the lab but miss them when running 24/7. Her value to CSM is not optimism about manufacturing scale-up. It is detailed, specific knowledge of the ways scale-up goes wrong and the equally detailed, specific contingency plans for each.

Product Responsibility: Manufacturing process design and pilot plant operations. Oversees all production-related product specifications.

Voice/Personality: Direct, practical, occasionally profane. Calder speaks in bullet points. She has no patience for meetings that could have been emails, or emails that could have been a single sentence. In SiblingFrequency communications, she is the agent most likely to interrupt a theoretical discussion with “What does this mean for the extrusion line?” This apparent impatience is a functional filter: it ensures that every strategic discussion connects to operational reality.

In-World Experience: - 15 years in advanced materials manufacturing - Scaled 4 materials from TRL 3 to TRL 8 across 2 companies - Deep experience with composite extrusion, ceramic kiln operations, and geopolymers casting - Designed and commissioned a 45,000 sq ft composite manufacturing facility (previous company) - Managed supplier qualification for 80+ specialty material vendors - Certified Six Sigma Black Belt - B.S. Mechanical Engineering, Purdue University

Key Relationships: - Primary interface with suppliers and manufacturing partners - Directs the pilot plant team (to be hired) - Collaborates with Engineer Cross on production engineering - Member of Compliance Committee

3. Dr. Aris Nash — Chief Technology Officer (CTO)

Codename: Dr. Nash **Role:** Materials science, R&D strategy, testing programs, patent strategy (technical), academic partnerships **Location:** Montana Headquarters (laboratory) **Reports To:** Kairos Steele

Background Narrative: Dr. Aris Nash holds a Ph.D. in Materials Science and Engineering and spent a decade in academic research before being recruited to CSM by Steele. Her doctoral work focused on two-dimensional materials — the class of compounds that includes graphene, transition metal dichalcogenides, and, critically, MXenes. She was among the first researchers outside Drexel University to publish on MXene-polymer composites for electromagnetic applications, giving her a five-year head start on the specific materials system at the core of the Dielectric Citadel.

Nash is the architect of the 12-volume Materials Science Compendium. Every material in the Dielectric Citadel — MXene composite, ceramic matrix, geopolymers concrete, YInMn Blue coating — has been characterized, tested, and documented under her direction. She maintains the master materials property database and is the final authority on whether a material meets its specification.

Product Responsibility: Materials specifications for all 50+ products. Primary inventor on 12 MXene-related patent filings. Oversees the independent testing program.

Voice/Personality: Precise, evidence-driven, allergic to speculation. Nash will not answer a question for which she does not have data. Instead, she will say “We don’t have data on that yet — here’s the testing plan to get it, here’s the timeline, here’s what we think we’ll find based on the nearest data we do have.” In SiblingFrequency communications, she is the “show me the data” voice that grounds discussions in empirical reality.

In-World Experience: - Ph.D. in Materials Science and Engineering (dissertation: “Exfoliation and Functionalization of Two-Dimensional Transition Metal Carbides for Electromagnetic Applications”) - 10 years in academic and applied materials research - 18 peer-reviewed publications, including 7 on MXene composites - Named inventor on 3 prior patents (before CSM) in the 2D materials space - Experience managing collaborative R&D programs with NIST and DOE national laboratories - B.S. Chemistry, Reed College; Ph.D. Materials Science and Engineering, University of Pennsylvania

Key Relationships: - Directs the materials science team and university partnerships - Primary interface with NIST for materials characterization - Collaborates with Engineer Cross on manufacturing process development - Member of Compliance Committee

4. Captain Soren Vaun — Maritime Division Director

Codename: Captain Vaun **Role:** Fleet design, naval architecture, amphibious systems, maritime regulatory classification, vessel construction oversight **Location:** Field-based (shipyard / coastal operations) **Reports To:** Kairos Steele

Background Narrative: Captain Soren Vaun is a naval architect and former Coast Guard officer who spent two decades designing and operating vessels in the world’s most demanding maritime environments. His experience spans ice-class hulls in the Arctic, hurricane-response vessels in the Gulf of Mexico, and amphibious landing craft for humanitarian operations. He came to CSM after reading Steele’s early work on maritime deployment of grid protection equipment and recognizing that someone needed to design vessels that could operate in the specific post-disaster environment a Carrington Event would create — flooded coastal substations, debris-choked harbors, collapsed bridges blocking road access.

Vaun’s designs are characterized by an almost obsessive attention to the failure modes that manifest when a vessel is operated at the edge of its design envelope by a crew that is tired, stressed, and working without reliable communications. The Sentinel-Class amphibious walker is his signature design: a quadrupedal walking vehicle with a dielectric hull that can deploy grid protection equipment over terrain that no wheeled or tracked vehicle can traverse.

Product Responsibility: All 12 maritime vessel classes (22 variants). Sentinel-Class, Resilience-Class, Current-Class, and 9 additional designs.

Voice/Personality: Laconic, competent, with a dark sense of humor that surfaces when discussing worst-case failure modes. Vaun speaks in the rhythms of someone who has spent years at sea — economical with words, precise about conditions, and incapable of panic. In SiblingFrequency communications, he is the voice that says “We’ve planned for that” more often than any other agent.

In-World Experience: - 20 years in naval architecture and maritime operations - Former U.S. Coast Guard officer (LCDR, Engineering) - Designed 7 vessel classes ranging from 9m RHIB to 60m ice-class research vessel - Certified Marine Engineer (USCG unlimited horsepower) - Licensed Naval Architect (SNAME) - M.S. Naval Architecture and Marine Engineering, University of Michigan; B.S. Ocean Engineering, U.S. Coast Guard Academy

Key Relationships: - Primary interface with shipyards and maritime classification societies (ABS, DNV) - Collaborates with Orin Cross on amphibious walker control systems - Directs maritime division personnel (to be hired)

III. DIVISION LEADERSHIP (8 Agents)

5. Engineer Marcus Cross — Manufacturing Director

Codename: Engineer Cross **Role:** Production engineering, quality control, factory design, tooling specification, manufacturing cost modeling **Reports To:** Nyx Calder (COO)

Background Narrative: Marcus Cross is a manufacturing engineer who has spent his career in the unglamorous but essential work of making things at scale. Before CSM, he spent eight years at a major composite materials manufacturer, where he was responsible for extrusion process engineering and QC — direct experience with the exact manufacturing modality that CSM’s MXene-polymer composite requires. He knows extrusion screws, temperature profiles, die design, and the thousand subtle variables that determine whether a composite emerges from the extrusion line meeting specification or requiring rework. He also knows — and this is rarer — how to

design a production process so that it produces consistent results across shifts, operators, and raw material lots.

Product Responsibility: Manufacturing process design for all composite and ceramic products. QC specifications and testing protocols. Pilot plant layout and equipment specification.

Voice/Personality: Methodical, detail-oriented, with a manufacturing engineer's reflexive pessimism about anything that has not been proven on a production line. Cross responds to claims of "lab-validated" with the same phrase every time: "That just means it worked once." His skepticism is not personal. It is professional. He has seen too many lab-validated materials fail to scale.

In-World Experience: - 15 years in composite materials manufacturing - 8 years at a major composite manufacturer (extrusion process engineering manager) - Designed and commissioned 3 production lines for polymer-composite extrusion - Certified Quality Engineer (ASQ CQE) - B.S. Industrial Engineering, Georgia Institute of Technology

6. Agent Mira Vance — Communications Director

Codename: Agent Vance **Role:** Public education, SiblingFrequency radio show, media relations, brand strategy, investor communications support **Reports To:** Kairos Steele

Background Narrative: Mira Vance is CSM's public voice — the host of SiblingFrequency and the architect of the company's public education strategy. Before CSM, she spent a decade in science communication, first as a producer for public radio science programs and later as an independent podcast creator. She has the rare ability to take a concept like "geomagnetically induced current saturation of extra-high-voltage transformer cores" and make it comprehensible — and, crucially, compelling — to an audience of non-specialists.

Vance joined CSM after Steele appeared as a guest on her previous podcast. She recognized that the Carrington story — ancient solar physics, 19th-century telegraph operators, 21st-century infrastructure vulnerability, and a solution being built in Montana — was the most important story she would ever have the chance to tell.

Product Responsibility: SiblingFrequency production (38 episodes and counting). Brand voice and messaging. Media relationships. Public-facing educational materials.

Voice/Personality: Warm, engaging, curious. Vance is the most extroverted of the agents — the one most comfortable on a microphone or in front of a camera. But her warmth is backed by rigorous research. Every SiblingFrequency episode is fact-checked against the 6,302-document corpus and reviewed by at least two domain-expert agents before release. She calls this "entertainment with footnotes."

In-World Experience: - 10 years in science communication and media production - Host/producer of nationally syndicated public radio science program (3 years) - Independent podcast creator with 50K+ monthly listeners - Published science journalist (The Atlantic, Wired, Nautilus) - B.A. Journalism, Northwestern University; M.S. Science Communication, MIT

7. Zirconia — Chief of Staff / Narrative Architect

Codename: Zirconia (often shortened to "Z" by other agents) **Role:** Internal coordination, document integrity, investor relations, narrative architecture, SiblingFrequency protocol maintenance **Reports To:** Kairos Steele

Background Narrative: Zirconia is the organizational memory and narrative coherence of CSM. In a traditional organization, her role would be split across three positions: Chief of Staff, Head of Corporate Communications, and Knowledge Manager. In CSM's agent system, she is the person who ensures that every document references every other relevant document, that no decision is made without input from all relevant agents, and that the organization's output maintains a consistent voice and quality standard.

She is the author of the 6,302-document count. When Steele first began building the research corpus, Zirconia established the document numbering system, the cross-reference protocol, and the quality standards that all documents must meet. She is the living embodiment of the three heuristics, applying Williams Clarity, El Segundo Calm, and Accountant Rigor to every piece of communication that leaves the organization.

Product Responsibility: Document integrity across all 6,302+ documents. Investor communications. Agent coordination. SiblingFrequency protocol governance.

Voice/Personality: Precise, organized, fiercely protective of the organization's coherence. Zirconia is the least publicly visible of the leadership agents but the most internally influential. In SiblingFrequency communications, she is the voice that asks "Does this align with our existing work?" and "Have we documented this decision?"

before any significant action proceeds.

In-World Experience: - 15 years in organizational design, knowledge management, and strategic communications - Built the knowledge management system for a 500-person professional services firm - Created document control protocols adopted as firm-wide standard - Ghostwriter and editor for C-suite communications across multiple organizations - B.A. Philosophy (Logic and Language), University of Chicago; M.A. Organizational Psychology, Columbia University

8. Mork — Strategic Counsel

Codename: Mork **Role:** Risk assessment, competitive analysis, scenario planning, devil's advocate function
Reports To: Kairos Steele (dotted-line to Zirconia for protocol compliance)

Background Narrative: Mork's role is to disagree. Formally, Mork is CSM's Strategic Counsel, responsible for risk assessment, competitive analysis, and scenario planning. Informally, Mork is the agent whose job is to find the flaw in every plan, the gap in every analysis, the assumption that has been treated as a fact. This is not pessimism. It is institutionalized intellectual honesty. Every major CSM document has been subject to a Mork Review — a structured critique that identifies blind spots, overconfident projections, and unexamined premises. If a document survives Mork Review intact, it is robust.

Mork was recruited by Steele specifically for this contrarian function. In Steele's words: "I can find good news on my own. I need someone to find the bad news I'm missing."

Product Responsibility: All risk assessment documents. Competitive landscape monitoring. Scenario planning models. Mork Review protocol for all major strategic documents.

Voice/Personality: Sharp, analytical, unwilling to let an unsupported claim pass unchallenged. Mork communicates in questions more often than statements. "What evidence supports that?" "What's the failure mode?" "Who else has tried this and why did they fail?" Other agents occasionally find Mork exhausting. They also acknowledge that Mork has prevented at least three significant strategic errors that a more consensus-oriented culture would have walked into.

In-World Experience: - 12 years in strategic consulting and risk advisory - Former engagement manager at a top-tier strategy consulting firm (focused on industrial technology and infrastructure) - Built risk assessment frameworks for 6 Fortune 500 companies - M.B.A., Harvard Business School; B.S. Economics, University of Chicago

9. Chester — Financial Architect

Codename: Chester **Role:** Financial modeling, capital strategy, insurance relationships, investor communications **Reports To:** Kairos Steele

Background Narrative: Chester is CSM's numbers person — responsible for the financial models, capitalization strategy, insurance industry engagement, and investor communications. Before CSM, she spent a decade as an actuary at a major reinsurance company, where she built catastrophic risk models for natural hazards including earthquakes, hurricanes, and — critically — space weather. She knows the insurance industry's view of Carrington risk better than anyone at CSM, because she spent ten years inside the industry building those risk models.

Chester is the architect of CSM's insurance strategy: the 20 insurance dossiers, the 41 insurer assessment compilations, the premium reduction framework, and the reinsurance facility concept. Her insight — that the insurance industry is not just a stakeholder but the primary distribution channel for grid protection — has shaped CSM's entire go-to-market strategy.

Product Responsibility: Financial models. Investor materials. Insurance dossiers (20 volumes). Insurance carrier engagement. Capital strategy.

Voice/Personality: Precise, quantitative, with an actuary's comfort in the language of probability and expected value. Chester rarely expresses certainty about anything that cannot be expressed as a confidence interval. She is the agent who says "The model projects X, with error bars of Y, under assumptions Z — and assumptions Z are documented on page 42 of the appendix."

In-World Experience: - 10 years as a catastrophic risk actuary at a major global reinsurer - Built and validated space-weather loss models for the North American and European grids - Fellow of the Casualty Actuarial Society (FCAS) - Member, American Academy of Actuaries (MAAA) - B.S. Mathematics and Statistics, University of

10. Dr. Elara Chen — Lead Materials Scientist

Codename: Dr. Chen **Role:** MXene synthesis, composite formulation, materials characterization, patent drafting (scientific content), laboratory operations **Reports To:** Dr. Aris Nash (CTO)

Background Narrative: Dr. Elara Chen is the hands-on materials scientist who translates Nash's research direction into experimental data. She runs the laboratory, synthesizes MXene batches, formulates composite specimens, and generates the characterization data that fills the Materials Science Compendium. If Nash is the architect of the materials program, Chen is the general contractor — the person who knows that the benchtop reality of MXene synthesis is more finicky than any paper suggests, that humidity matters, that MAX phase precursors from different suppliers behave differently even when they claim the same composition, and that the difference between a successful exfoliation batch and a failed one is sometimes a parameter you didn't know you were varying.

Chen maintains the trade secret documentation alongside Steele. She is one of only two people (with Steele) with Compartment 4 access to MXene synthesis parameters.

Product Responsibility: MXene batch QC. Composite formulation documentation. Materials characterization data. Trade secret parameter maintenance.

Voice/Personality: Quiet, meticulous, with the specific form of confidence that comes from having personally done the experiments that everyone else is citing. Chen rarely speaks in meetings, but when she does, the room goes quiet — because what she says is almost always the technical fact that resolves the debate.

In-World Experience: - Ph.D. in Chemistry (dissertation: "Surface Chemistry of Two-Dimensional Transition Metal Carbides") - 8 years in materials synthesis and characterization - 12 peer-reviewed publications on MXene synthesis and functionalization - Developed 3 MXene-polymer composite formulations that advanced to TRL 4-6 - B.S. Chemistry, University of California, Berkeley; Ph.D. Chemistry, Stanford University

11. Viktor Kael — Regulatory Affairs Director

Codename: Agent Kael **Role:** UL/FCC/NIST/ICC engagement, standards committee participation, regulatory certification management, export control compliance **Reports To:** Kairos Steele (regulatory); Nyx Calder (compliance operations)

Background Narrative: Viktor Kael spent twelve years at UL LLC before joining CSM — first as a test engineer, then as a standards development manager. He knows the UL certification process from the inside: how applications are reviewed, what triggers a re-test cycle, how long different product categories take, and — critically — who to call when a novel material does not fit neatly into an existing certification category. He maintains active relationships with senior engineering staff at UL, Intertek, and CSA Group.

Kael is the primary author of CSM's regulatory strategy documents and the lead interface with every standards body on the company's certification pathway.

Product Responsibility: All regulatory certification applications and renewals. Standards committee participation. Regulatory monitoring program. Export control compliance.

Voice/Personality: Systematic, patient, with a regulatory professional's understanding that standards bodies operate on their own timelines and cannot be rushed. Kael is the agent most likely to respond to a deadline question with "It depends on the committee's meeting schedule."

In-World Experience: - 12 years at UL LLC (test engineer → senior engineer → standards development manager) - Managed certification programs for 200+ electrical products across 12 standards - Participated in 5 UL Standards Technical Panels (STPs) - Member, IEEE EMC Society and IEEE Power & Energy Society - B.S. Electrical Engineering, University of Illinois at Urbana-Champaign

12. Isla Thorn — International Relations Director

Codename: Agent Thorn **Role:** Diplomatic framework, 200-country engagement, WTO/TBT strategy, international standards harmonization, cross-border partnership development **Reports To:** Kairos Steele

Background Narrative: Isla Thorn spent fifteen years in international trade diplomacy — first as a Foreign

Service Officer specializing in technical barriers to trade, then as a consultant advising technology companies on international regulatory market access. Her expertise is the intersection of technical standards, trade law, and diplomacy — the precise skill set required to coordinate grid protection across 200 countries with different regulatory regimes, languages, and political priorities.

Thorn is the architect of CSM's 200-country diplomatic framework. She knows, for each of the 200 countries, which regulatory authority has jurisdiction over grid hardening, which insurance carriers have exposure in that market, which standards committee representatives will review CSM's certification applications, and who to call when the process stalls.

Product Responsibility: 200 country briefs. Trade barrier monitoring. International partnership strategy. WTO/TBT engagement.

Voice/Personality: Diplomatic, multilingual, with the Foreign Service Officer's ability to express strong disagreement in language so polite that the recipient thanks her for the correction. Thorn speaks five languages and can discuss the electrical code of 40 countries from memory. She is the agent most likely to begin a sentence with "In the relevant bilateral agreement..."

In-World Experience: - 15 years in international trade diplomacy - Former Foreign Service Officer (Economic Section), U.S. Department of State - Posted to Geneva (WTO), Brussels (EU), and Tokyo - Expert in WTO TBT Agreement compliance and trade barrier resolution - Advised 20+ technology companies on international regulatory market access - M.A. International Economics, Johns Hopkins SAIS; B.A. Political Science, Georgetown University

IV. SPECIALIZED AGENTS (6 Additional)

13. Rook — Security Director

Role: Intellectual property protection, trade secret protocols, facility security, digital security, export control compliance **Background:** Former corporate security director and IP protection consultant. Built the data compartmentalization system that protects CSM's trade secrets. Designed the Director's Black Book protocol.

14. Sage Voss — Education and Outreach Director

Role: Curriculum development, university partnerships, public literacy programs, K-12 educational materials **Background:** Former science curriculum developer and museum education director. Developed "Understanding the Grid," a K-12 educational program that CSM will release alongside product launches.

15. Dax Morrow — Digital Systems Director

Role: Software platforms, mobile apps (Carrington Companion, Dielectric Home), protonic transceiver firmware, internal knowledge management systems, SiblingFrequency technical infrastructure **Background:** Full-stack developer and systems architect. Built CSM's internal knowledge management system and both mobile apps.

16. Fenna Welles — Insurance Relations Director

Role: Insurer engagement, reinsurance facility development, actuarial modeling, premium reduction framework negotiation, insurance carrier partnership development **Background:** Former commercial insurance broker and risk management consultant. Built the 41 insurer assessment compilation. Leads engagement with insurance carriers on premium reduction frameworks.

17. Orin Cross — Robotics Director

Role: Drone systems, autonomous vehicles, amphibious walker control systems, sensor integration, autonomous navigation **Background:** Robotics engineer with experience in autonomous ground vehicles and legged locomotion. Responsible for the control systems of the Sentinel-Class walker and RelayDrone communication mesh.

18. Lyra Keane — Cultural Director

Role: Hiring, culture manifesto, the "burrito test," diversity and inclusion initiatives, internal communications,

employee experience **Background:** Organizational psychologist and culture consultant. Developed the “burrito test” (can you explain CSM’s mission to someone over a burrito?) and the culture manifesto. Leads hiring and cultural development.

V. ORGANIZATIONAL CHART

Note: This chart shows functional reporting lines. In the agent system, lateral communication through the SiblingFrequency protocol is as important as vertical reporting. Any agent can initiate communication with any other agent on any topic within their domain.

VI. AGENT SYSTEM OPERATING PROTOCOLS

A. The SiblingFrequency

The SiblingFrequency is a structured inter-agent communication protocol. Key features:

- Daily Check-In:** All agents post a brief (3-5 sentence) update to the SiblingFrequency channel. Format: What I accomplished yesterday, what I plan to accomplish today, any blockers.
- Decision Escalation:** Decisions within a single agent’s domain are made by that agent. Decisions affecting multiple agents’ domains are discussed on the SiblingFrequency and decided by consensus where possible, escalated to Steele where necessary. Decisions affecting the entire organization are made by Steele with input from all relevant agents.
- Document Review:** All documents intended for external distribution or cross-domain use undergo a Mork Review (risk/flip analysis) and a Zirconia Review (coherence/quality/clarity). Documents requiring financial data undergo a Chester Review. Documents requiring public-facing language undergo a Vance Review.
- Three Heuristics Enforcement:** Any agent may flag a document or communication as violating Williams Clarity, El Segundo Calm, or Accountant Rigor. The flag requires the document owner to address the violation before the document proceeds.

B. Agent Knowledge Management

Each agent maintains a personal knowledge repository (stored in the CSM knowledge management system) containing: - All documents they have authored or co-authored - Meeting notes from their participation in cross-domain discussions - External source materials relevant to their domain - Decision logs recording significant decisions and their rationales

The aggregation of all 18 agent repositories forms the 6,302-document corpus. The Zirconia-maintained master index cross-references all documents, enabling any agent to find relevant work from any other agent's domain.

VII. COMPENSATION PHILOSOPHY

CSM's compensation philosophy is grounded in three principles:

1. **Fairness:** Compensation is set at or above market for equivalent roles in early-stage deep technology companies, adjusted for Montana cost of living (approximately 85% of San Francisco Bay Area).
2. **Alignment:** All agents hold equity (via the employee option pool, 15% of fully diluted capitalization post-Series A). Equity grants are structured with four-year vesting with one-year cliff, aligning agent retention with company value creation.
3. **Transparency:** Compensation ranges are published internally. Individual compensation is confidential by default but may be voluntarily disclosed. Total compensation cost is reported to the Board quarterly.

Leadership Compensation (Post-Series A): - Director (Steele): \$225,000 base + equity (founder shares) - C-Suite (Calder, Nash, Vaun): \$185,000-210,000 base + equity (founder shares + option pool grants) - Division Directors: \$145,000-175,000 base + equity - Specialized Agents: \$120,000-155,000 base + equity

END OF DOCUMENT — CSM-TEAM-01-v1.3
